ABSTRACTED-PUB-NO: WO2003029824A

BASIC-ABSTRACT:

NOVELTY - Diagnosing (early or differential diagnosis; assessment of severity; monitoring therapy and prognosis of disease progression) chronic inflammatory bowel disease by detecting, in the serum, plasma, tissues and/or feces of patients (or subjects at risk) presence or absence of one or more antibodies (Ab) that bind ribosomal proteins (rP).

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) use of the P0 and/or L5 rP, complete or as adducts, phosphorylated products, peptide fragments or analogs, or as a bowel-specific splice variant, to prepare a composition for binding or blocking antibodies against the specified proteins, for treatment of Crohn's disease (CD) and/or ulcerative colitis (UC);

(2) use of the materials of (1) for inhibiting intestinal and associated inflammation in treatment of CD and/or UC, by blocking antigen-presenting cells or by inducing T cell anergy; and

(3) composition for treating CD or UC comprising agents that bind to antibodies against P0 and/or L5, so as to prevent them from binding to these proteins.

ACTIVITY - Antiinflammatory; Antiulcer. No details of tests for these activities are given.

MECHANISM OF ACTION - Ribosomal proteins and their derivatives (i) bind to/block antibodies, preventing them from binding to P0 and L5; (ii) block antigen presenting cells and/or (iii) induce T cell anergy.

USE - The method is used for diagnosis of Crohn's disease, ulcerative colitis and their mixed form (colitis indeterminata). Ribosomal proteins, and their derivatives, are useful for treating these diseases, either by extracorporeal treatment or by administration.

CHOSEN-DRAWING: Dwg.0/3
